Abstract: *The use of artificial intelligence, which completely eliminates the need for human involvement in content creation, presents significant challenges in verifying the authenticity of a particular work. Until now, humans were required to create specific work, but with the development of artificial intelligence algorithms, the creation of all types of content is now possible within seconds through modern technology. From a legal perspective, copyright implies that the creator of a work (usually literary, scientific, or artistic works) is the actual author who can protect their creation and classify it as intellectual property. When a work is created by an artificial intelligence algorithm, it cannot be classified as copyrighted, as it was not fully created by a human and does not represent an original creation. However, due to its nature, works created by such algorithms cannot legally be recognized as original creations of an author, these works remain in the public domain, with no possibility of claiming copyright over them.*

The aim of this paper is to analyze the legal and ethical dilemmas involved in content creation, with a proposed solution to the regulation of intellectual property rights in the age of artificial intelligence. The paper explores legal approaches to this issue and emphasizes the importance of respecting and adapting the Copyright and Related Rights Act.

Keywords: *Artificial intelligence, copyright, intellectual property, content creation, legal and ethical dilemmas.*
